

Keep Track of All Your Mobile Devices with Waizu Solutions - Available from Dakota

- Are you impacted by workflow downtime because your mobile devices have gone missing?
- Do you spend valuable time every week trying to locate these missing devices?
- Do you permanently lose your mobile devices, spending thousands of pounds to replace them?

With organisations estimated to lose or misplace between 12% and 15% of their mobile devices every year, the adoption of a greater control mechanism to fully manage these devices is essential.

Whether your mobile device estate is made up of tablets, smart phones, rugged PDAs or a combination of all three, the cost of downtime and unnecessary device replacement can run into thousands of pounds annually and can have a negative impact on staff productivity and patient flow.

Eliminate these unnecessary issues with the Waizu Device Finder Software Solution – available from Dakota

Mobile device-based solutions have become a critical part of patient care and wider healthcare operations. If there is a shortage of mobile devices or if devices within your estate are not running at full capacity, this will have a direct impact on patient treatment, staff workflows and track and trace systems.

It is therefore essential that hospitals and medical centres effectively and efficiently manage and control their assets, data and medical inventories, whilst ensuring full UDI compliance.

Put simply, today's healthcare organisations rely heavily on mobile devices, so device management and device battery management are critical in safeguarding the smooth flow of mission-critical processes and procedures.

Do your healthcare professionals lose time locating a working device?

Whilst Mobile Device Management (MDM) products are a vital element in rolling out and maintaining mobile devices in the field, these traditional MDM tools are not sufficient to resolve the problems of devices going missing due to poor device traceability.

On average, healthcare professionals can waste up to twelve minutes per shift trying to locate missing mobile devices. If a typical treatment area has four professionals, that could equate to anything up to one hour per shift.

Being equipped with the knowledge of who has which device and where, the Waizu Device Finder Solution can give back that wasted time and significantly increase patient throughput across any hospital or similar healthcare facility.

Understanding device utilisation is key to budget-restricted hospitals

It is also critical to understand whether you have got enough devices to equip all your departments properly, as well as knowing if the batteries in those devices are lasting for the duration of a full shift.

The Waizu Device Finder Solution can help to dramatically increase healthcare professional efficiency by ensuring that each device location can be accurately pinpointed throughout a facility as well as indicating information such as its battery state, who is using or has used the device and providing alerts when a device looks like it is lost or missing to support device location and retrieval. Delinquent devices can then be identified and removed from the estate proactively to be returned once back in a suitable and usable state.

By monitoring device utilisation, Healthcare Managers can effectively supervise device numbers and usage across all departments (where practicable) to ensure that excess devices are not sitting idle.

The solution also provides real-time battery health indicators to ensure that clinicians pick up a 'healthy' device each and every time, whilst making sure that faulty batteries are identified and replaced when needed and that healthy batteries are not replaced based upon age alone.
